

CLINICAL NARRATIVE - APPEAL DOCUMENTATION

Patient: Ashley Johnson

DOB: 1966-04-29

Tooth: #31

Procedure: D3346 - Retreatment of previous root canal therapy - anterior

Clinical Findings:

Patient presented on 2025-08-12 with chief complaint of sensitivity to hot and cold. Clinical examination revealed recurrent decay beneath existing crown. Radiographic evaluation confirmed horizontal bone loss exceeding 50%.

Treatment Rationale:

The recommended procedure (Retreatment of previous root canal therapy - anterior) is medically necessary because the existing restoration has failed and the remaining tooth structure is insufficient. Alternative treatments considered include pulp capping, however these were deemed inadequate due to poor long-term prognosis with conservative approach.

Prognosis:

With appropriate treatment, prognosis is good. Without treatment, patient risks spread of infection to adjacent teeth.
