

CLINICAL NARRATIVE - APPEAL DOCUMENTATION

Patient: Anthony Rodriguez

DOB: 1995-10-27

Tooth: #30

Procedure: D7240 - Removal of impacted tooth - completely bony

Clinical Findings:

Patient presented on 2025-05-21 with chief complaint of swelling of the gingiva. Clinical examination revealed recurrent decay beneath existing crown. Radiographic evaluation confirmed horizontal bone loss exceeding 50%.

Treatment Rationale:

The recommended procedure (Removal of impacted tooth - completely bony) is medically necessary because periodontal disease has progressed to an advanced stage. Alternative treatments considered include extraction without replacement, however these were deemed inadequate due to insufficient remaining tooth structure.

Prognosis:

With appropriate treatment, prognosis is guarded but improved with treatment. Without treatment, patient risks spread of infection to adjacent teeth.
